

Dockerhub url: ["subashniraula6/docker-web-api - Docker Image | Docker Hub"](https://hub.docker.com/r/subashniraula6/docker-web-api)

Problem 2: Building a Docker Image

1. For this problem, I simply created Express server and created route 'http://localhost:8080/api/email'. By doing GET request to that endpoint simply returns dummy json value that is displayed when that url is loaded. For Docker build process, I used linux alpine version of node.

Commands to run:

1. `docker pull subashniraula6/docker-web-api:v2`
2. `docker run -it -p 3000:8080 subashniraula6/docker-web-api:v2`

Output:
